

Hi everyone! We all know the potential transformation that Generative AI can bring to the society. We see this with a push in scientific research that touts AI as inevitable or even solve the biggest humanitarian crises.

Click

Not for everyone! This acceleration, unfortunately, comes with a societal cost! As an example, in collaboration with local governments, Big Tech companies are stealing lands from black and indigenous communities in the US, to build data centers and power plants.

Click

Data Centers extract scarce resources, pollute the air, the drinking water, resulting in extremely high cancer rates and job losses due to labor automation.

Click

And as of recently, the produce EMF waves that are even killing the honeybees that are crucial to our ecosystem.

click

Tribal nations worry that data centers mimic extractive industries like mining and oil that have historically perpetuated sex trafficking and domestic violence in their communities.

3

The fundamental tension that underlies this colonization is how Western science treats the natural resources as a "commodity" that they can exploit. On the other hand, Indigenous worldview treat nature as a relative they need to protect as it has sustained them for thousands of years.

Click

As a result, Communities across the US are fighting back and demanding accountability! Recent reports suggest that most people do not want Data Centers in their neighborhoods.

Click

They are organizing through offline and online social media spaces to form the biggest resistance movement in recent times.

Click

And they are winning! In just 3 months this year, more than 75 data center projects worth 130 billion \$ have been blocked or delayed.
