

As digital technologies become increasingly entrenched and ubiquitous in everyday life, it raises privacy and safety challenges, especially, in control of adversarial entities. Although, traditional threat models assume distant or unknown adversaries, they overlook scenarios where the adversary and the victim are related through their physical proximity, social identities, & power dynamics. Some of the most intimately-felt violations happen through when technologies are exploited by a known person (e.g., abusive partners) or through structural inequities (e.g., disproportionate exposure to violence on gender & racial lines). Parallels exist between both, interpersonal and structural violence, through the underlying adversaries' assertion of power & control to violate a victim's privacy and safety. Stalking from an intimate partner underlies the similar oppressive logics embedded in States' misuse of crime databases to violate Indigenous peoples; just at different scales. To guarantee security and safety against such violations, therefore, requires building interventions that center sensitive impacts of violence, agency and safety needs, moving the needle from surviving to thriving.

My research examines **how technology enables gender-based interpersonal and structural violence (GBV)**, and yet, **provide spaces of reclamation and radical possibility that fosters collective safety, resistance, and liberation** among impacted communities. To do this, I expand the traditional discipline boundaries. My research engages with many disciplines: Human-Computer Interaction (HCI), Security & Privacy (S&P), and Social/Critical Computing. I have made contributions across two woven threads:

1. **Designing interventions to support interpersonal violence survivors**, by measuring the prevalence of technology violence experiences in college context [Late-Breaking CHI 2024]. I surface barriers faced by survivors in taking supportive strategies [USENIX 2024, Late-Breaking NDSS 2024]. With GBV organizations, I build educational interventions to embolden advocates [In-review CSCW 2027] and tools to help survivors collect legal evidence [CSCW 2025, CHI 2026, CCS 2025, In-review USENIX 2027].
2. **Research and design framework to help communities liberate from structural violence**, by demonstrating how technological infrastructures used by the State and BigTech perpetuate settler-colonial violence on Indigenous peoples [In-review CSCW 2027] and their land. By centering resistance movements, I surface a research and design framework that centers communities' resistance and reclamation of technological infrastructures, helping them liberate from structural violence.

In the coming years, I will expand on these themes to critically examine emerging technologies (e.g. LLMs, wearables, missing persons alerts). As technology evolves, it will continue to produce opportunities, yet, reproduce harms to vulnerable communities. Drawing on my expertise and collaborations with scholars and students, I plan to develop a theoretically- and community-engaged research program to shape how technology design can provide safety instead of oppression.

Research Process. Globally, an estimated 30% of women (736 million) experience physical/sexual intimate partner violence (IPV) in their lifetime [10]. Particularly, 84.3% of Indigenous women face intimate violence, 10x likely to be murdered than the national average [11] and represent 40% of sex trafficking victims [12]. Exposure to violent experiences take away power, control, and agency from survivors, making it difficult to mitigate violence and find safety. Consequently, survivors face downstream healthcare impacts e.g. high rates of substance abuse, health inequities, and limited access to health care resources. Plus, this work is extremely challenging, emotionally & logistically complicated, and leads to vicarious trauma, especially with political uncertainties related to identity-focused research. Addressing such violences, therefore, requires restorative and transformative interventions that build confidence and resilience.

I ground my research process in feminist and decolonial Indigenous onto-epistemological lens such as trauma-informed care [13], desire-centering [14], place-based knowledge and relationality [15–18], epistemic justice [19, 20], necropolitics [21], and refusal [22, 23]. I assess communities' needs by utilizing a research process that foregrounds their lived experience, agency, and care. Through the "Upstream Story" framework in public health (see Figure 1), by centering survivors' lived experience, I identify unique opportunities that focus on early interventions towards proactive prevention than reactive solutions. To gather lived experiences, I exercise methodological flexibility through a sensitive and non-extractive approach that reduces the cultural and reflexive distance by incorporating meaning-making from the margins. My first instinct is always to collaborate with impacted communities through a participatory-action oriented model. However, that is not always a possibility due to logistical limitations and overburdened responsibilities of anti-violence workers. In lieu of participation, I collaborate with field experts in domestic & sexual violence, indigenous health, trafficking, and, education. To gather experiences, I have used a variety of methods such as interviews/focus groups, surveys,

Figure 1: **Upstream Story** [24] – My work focuses on each part of the stream to effectively prevent violence by building interventions (a) downstream to support survivors’ immediate needs after the abuse has occurred, (b) midstream to support survivors’ coping strategies to mitigate abuse, and (c) upstream to prevent survivors from falling into the river.

large-scale content analysis, autoethnography, and, system design. After designing an intervention, I work with the communities to assess effectiveness in practice and iterate on the design. Finally, I examine how research interventions may generalize and scale in high-stakes contexts [In-review CSCW 2027].

1 Designing Interventions to Support Interpersonal Violence Survivors

To direct interventional research and resources effectively, it is crucial to understand the statistics of the most and least frequent tech violence experiences and support-seeking strategies. Using college campuses as one such context, I studied [Late-Breaking CHI 2024] the prevalence of interpersonal tech violence and support strategies, through a survey of 776 US college students. Alarming, 70% of students experienced such experiences: 60% faced unwanted calls and messages, 51% non-consensual sharing of intimate images/videos or messages. Also, women (2x) and LGBTQ+ (3x) students were more likely to face violence than men, showing that tech violence is a gendered issue. Importantly, more than half (53%) students did not seek support. When they did, most students (93%) solely relied on informal systems like friends and family, and only 6% solely sought formal systems. Therefore, an early intervention may nudge survivors to reach out to informal systems.

The prevalence study, however, does not explain *why* survivors do not seek support and what happens when they do. To understand this, I interviewed nine survivors to examine their experiences in seeking support from their community and the effectiveness of support in addressing their needs. This study [USENIX 2024] underlined the barriers that impeded the survivors from seeking support and the challenges during the support process. Survivors and support systems downplay the severity of violence and deem it as less priority as compared to physical or sexual violence due to a lack of visible signs of abuse. Survivors are often disbelieved and provided with an ineffective advocate to mitigate abuse due to a lack of adequate resources. Moreover, support providers use unsafe technological mediums to communicate, especially challenging when abusers often isolate them or escalate violence. I discovered an ecosystem of care by survivors who participated in and exchanged help to other survivors through social media support groups. The key takeaway is that, despite not being an expert, survivors and their informal systems collaborated to improve their healing and agency for recovery.

To foster this ecosystem of care, my next study [In-review CSCW 2027] conducted educational interventions to build knowledge capacity among advocates in collaboration with eight host GBV organizations. These trainings inform advocates’ care practices towards the goal of detecting and preventing violent experiences early in the survivors’ care journey. Moreover, the epistemic knowledge gaps in identifying and mitigating newer, ever-evolving forms of tech violence is a deterrent for advocates in providing effective support to survivors [20]. Through pre- and post-surveys, we found that the trainings increased advocates’ perceived understanding of vectors of violence and their impacts on survivors. It also increased advocates’ confidence in providing support, safety planning, and referrals through collaboration with community stakeholders. Then, I conducted retrospective reflections through autoethnography to surface key lessons, contestations, and tensions that emerged in designing and facilitating trainings. To help scholars design their own interventions in respective high-stakes contexts, the study creates a concrete checklist based on key phases of the study: coordinating logistics flexibly, reducing reflexive distance from host organizations and attendees, and using field experience to tailor content

for accessibility. Moreover, I helped co-design *Sherloc* [CSCW 2025, CHI 2026], a tool that helps consultants capture and prepare an evidence report that a survivor can print and take to a court case to get relief injunctions, such as a restraining order or a divorce settlement. Finally, *Lestrade* [CCS 2025, In-review USENIX 2027], on the other hand, reduces uncertainty within account security interfaces by utilizing account data exports and creates a visual timeline to aide consultants run a more effective clinical investigation.

2 Research and Design Framework to Help Communities Liberate from Structural Violence

This line of work critiques the historical and ongoing role of technologies in perpetuating structural violence. Through this work, I expand the definition of violence can manifest on people, ecology, and knowledge systems. On the other hand, oppressed communities reconfigure technologies for advocacy, healing, and self-determination. This thread envisions a framework that critically engages with epistemic injustices and settler-colonial logics of extraction and domination, while, centering resistance and self-determination in research and design of interventions that liberate communities from structural violence.

For example, the Missing & Murdered Indigenous Relatives (MMIR) crisis is an ongoing genocide in Turtle Island (North America). comprehensive data on the exact number remains scarce in federal criminal databases, leaving most cases unresolved or inadequately investigated. Lucchesi and Echo-Hawk [25] found 5,712 cases of missing & murdered people but only 116 (2%) them were recorded in the US databases. I analyzed 140 news articles, advocacy & police reports, podcasts, and court hearings that consisted of stories of missing relatives, families, advocates, and tribal police. I found that inaccurate data collection, opaque data sharing policies, and lack of safe online spaces create challenges for communities to find relatives. Further, colonial institutions have historically misused and appropriated Indigenous knowledge without consultation. For example, the Royal Canadian Mountain Police installed five 5G towers along the “The Highway of Tears” to improve spotty cell service. However, without consulting Indigenous leadership, they left out many highways with spotty cell coverage by using a narrow definition of missing or murdered. Right now, most Tribes lack the access to the State criminal databases and agency to release alerts, forcing dependence on colonial institutions. Notably, Indigenous communities mount a generational resistance against State technologies and reclaim them as spaces of advocacy, memory, and care. Communities form a care ecosystem through missing-poster campaigns on social media, sovereign and crowd-sourced databases, and digital maps to search and rescue for relatives, provide support and healing to families, and raise awareness of the MMIR crisis. Recognizing the impact, [U of Michigan Prof. Rebecca Irvine](#) formally invited me to collaborate on a book.

Indigenous epistemologies equate violence on their peoples to extraction on their lands that sever the relational connections between the land and the people. AI has been touted as deeply transformational, having the potential to reshape our society on a global scale, fueling an accelerationist push towards scientific progress. Such an imperialist frontier promotes extraction of labor, commodification of natural resources, posing an existential and ecological threat to humankind. Under the false promises of jobs, economic, and, renewable energy development, BigTech companies (OpenAI, Anthropic, Google, Meta, xAI) are building out hyperscale data centers on Indigenous lands. Data centers require huge amounts of water, methane, or, air to function and cool their machines. For example, in 2023, data centers used over 66 billion liters of water for cooling [26], surpassing water use of entire city of Los Angeles for 2 weeks. Data Centers facilitate violence against Black and Indigenous communities: inflated energy bills, air and noise pollution, rise in cancer rates, sex trafficking, job losses due to automation, and, climate catastrophe. To fight back, Indigenous peoples lead resistance movements that refuse the privatization of land and extraction. Activists reclaim technologies to organize and resist through community knowledge-sharing workshops, responsible land-use policies, and, social media activism. This work re-imagines how sovereign and culturally-sensitive, sustainable, sovereign, and ethical AI can manifest and benefit the communities.

Future Agenda

1. Early Interventions to Empower Stakeholders across Cultures. Tech Clinics are a scarce resource that is not accessible to most survivors outside four metropolitan US cities¹. One direction will **(a) enable advocates in clinical contexts to detect interpersonal tech violence early**. Survivors typically fill out intake forms when they enter a shelter or a hospital to assess psychological, economic, and physiological safety Em-

¹There are four tech clinics in operation in the US: [CETA](#) in New York City, [MTC](#) in Madison, [TECC](#) in Seattle, and [MAVS-ETA](#) in Arlington.

bedding tech violence experiences into the intake forms will enable survivors to determine their digital safety early. Identifying harms early will reduce harm by flagging patients and redirecting them appropriate experts. Moreover, in clinical settings, for example, an individual safety planning may reinforce individualistic notions of privacy. Instead, signaling a shift towards a collectivist notion of safety, I will **(b) scale GBV providers to a peer support model** where healing happens with the community. In this model, peer support workers (PSWs) run support groups by sharing stories of violence, empowerment, and reclamation of agency [27]. These groups create a destigmatized space that redistributes epistemic and decision-making power, build technical skills, learn folk threat models, making safety planning less daunting for survivors. Utilizing my experience in training advocates [In-review CSCW 2027], I plan to co-design a structured program that empowers PSWs to effectively moderate and facilitate support groups. Finally, for rural and BIPOC survivors, culturally sensitive support systems are often inaccessible. Geographic isolation leads to infrastructure barriers: lack of stable internet access, digital literacy, resource constraints, and social barriers: cultural stigma, a close-knit community, police siding with abusers, slow justice system response. I will build a **(c) culturally-attuned tech clinic** that weighs survivors' dynamically changing cultural safety needs. This intervention will leverage the embedded knowledge infrastructure, weaving technology astuteness among the youth and generational teachings from Indigenous Elders. At MTC, we have supported 40 survivors with 15 rural organizations so far, by integrating remote consultations over Zoom in our service delivery protocol. My ongoing work evaluates the effectiveness of such an intervention model and how tech clinic consultants have navigated these consultations.

2. Surfacing and Resisting Structural Violence. My work will continue to reckon with structural violence faced by communities in the Majority World (e.g., war refugees, incarcerated, factory & delivery workers, immigrants, unhoused, construction workers). Intergenerational trauma faced by these communities have lasting health impacts. Such negative impacts may complicate their privacy & safety needs as more essential sector technologies get digitized. For example, what does privacy mean for international students who go through social media surveillance by the State to maintain their immigration status? Similarly, what does privacy mean for exploited factory workers in India who watch abusive content or wear cameras to train AI robots that will soon replace them? Through collaborations at University of Michigan, I plan to answer these questions through intersectional theoretical lenses; such as queer [28] and black feminism [29], caste oppression [30], anti-incarceration and abolition [31, 32], labor exploitation and surveillance capitalism [33, 34], and, geopolitical resettlement [35, 36]. My projects will **(a) measure the impacts of privacy challenges faced by communities subjected to structural violence**. Importantly, to acknowledge their daily flourishing and resistance, I will examine how **(b) communities use social media spaces for connection, organizing, and justice movements** and how their lived experiences can inform interventions and tech policy. Recognizing culture as a vital safety condition, my work will design **(c) frameworks for cultural preservation and revitalization through technologies** through stories, knowledge, languages at-risk of extinction. Finally, collaborating with health epidemiologists and violence-prevention practitioners, I will **(d) design technological visualizations tracing the systemic health inequities** with an aim towards providing culturally-competent interventions to curb them.

3. Decolonizing Digital Safety and AI Research. Scholars have noted that computing research and interventions reflect an imperial impulse [37–39]. However, without engaging with theories of change that center decoloniality, sovereignty, and liberation [40, 41], safety research may result in neoliberal siloed interventions that fail to address the privacy violations of peoples that power the Big Tech enterprise. For example, trust & safety teams in Big Tech companies often tout their products as private, ethical, carbon-neutral, whereas, the same companies actively harm miners who extract rare earth minerals in Congo and assemble their products in India. My computing and critical theory expertise allows me to view technologies not just as a black box, but as a combination of complex social and technical components. I will provide evidence to decolonize the definition of safety & privacy by tracing privacy violations in the entire lifecycle of BigTech AI products. To do this, I will conduct a **(a) review the positionality of scholarships that underpin the digital safety research**. Is the prior effectively addressing a variety of diverse harms and safety needs across AI abstraction layers, or, reinforcing a limited definition of online safety? Then, drawing on my workshop [Workshop HLF 2026], I plan to **(b) create a pluriversal framework for AI safety** by surfacing experiential and value misalignment between the BigTech corporate demands and the communities on the ground. The framework will provide opportunities shape AI towards a sustainable, sovereign, and ethical AI.
