POSTDOC STATEMENT | Naman Gupta

Through this postdoc fellowship, I want to challenge the coloniality and epistemic erasure embedded in AI and work towards making AI more value-sensitive, diverse and safe for everyone.

I will create a framework that will evaluate epistemic and physical violence witnessed by people involved in AIs' development and operations. I will contrast how Big Tech AI models and infrastructure disproportionately impacts people and land in and outside the imperial core (generally, WEIRD populations) and the periphery (generally, the majority world) and those who sit at their boundaries (Indigenous peoples in Western countries). This framework aims to unearth the extractive logics embedded in every layer of BigTech AI lifecycle, from data collection to model training, from extraction of minerals that form the physical AI infrastructure to privacy policies of the AI interfaces used by consumers. The framework will provide opportunities that shape AI safety that incorporates sustainability and sovereignty.

Scholars have noted that academic research reflect an imperial impulse [1–3]. Consequently, AI technologies center Western hegemonic and extractive understandings of safety, ethics, responsibility, and privacy and perpetuates epistemic violence [4] and enforces universalization and monoculture [5–7]. However, without engaging with theories of change that center decoloniality, sovereignty, and liberation from the Majority World [8–10], AI ethics and safety research may result in extremely narrow and scoped technical safety measures that further "AI inevitability", advancing AI towards a universal epistemology. Lazar and Nelson [5] calls out techno-solutionist fixes act as lip service or "safety-washing" that do not promote interdisciplinary sociotechnical approaches or needs of the peoples. There is a stark lack of ideological and demographic diversity that reproduce the very monoculture prevalent in generative AI models. Such a stance on AI and safety fail to address the privacy and human rights, democratic, justice violations of peoples and environments that are harmed the most, by the enormous colonial frontier of the Big Tech AI enterprise. For example, trust and safety teams in Big Tech companies often tout their products as private, ethical, carbon-neutral, whereas, the same companies actively exploit miners who extract rare earth minerals in Congo and assemble their products in India. BigTech companies create their own rules for trust, safety, and ethics and show meaningless numbers that they abide by it. On a similar vein, what does privacy mean for exploited factory workers in India who watch abusive content or wear cameras to train AI robots that will soon replace them? Similarly, ChatGPT promises privacy settings that ensure users' data is not used for model training, yet also, legally allows intimate partner abusers to generate fake nude images of their victims without consent.

Drawing on decolonial and feminist literature [10, 11], my goal is to make these contestations and values behind BigTech AI products visible by centering the lived experiences of Women and people of color, people who have anticipated and highlighted harms of technological endeavor throughout human history. Such a stance can inform AI safety and ethical frameworks beyond positivist and technical notions of safety metrics and benchmarks. A narrow definition of ethics, privacy, and safety only brings surface level interventions that rarely addresses the underlying structural violence and prevents communities from achieving long-term healing and liberation.

Methods. My computing and critical theory expertise allows me to view technologies not just as a black box, but as a combination of abstract social and technical components. I study impacts of violence through personal technologies (e.g., mobile accounts, AirTags) [NDSS-LBW 2024, CHI-LBW 2024, USENIX 2024, CCS 2025, In-review USENIX 2027, CSCW 2025, CHI 2026, In-review CSCW 2027] and from physical infrastructure (e.g., AI data centers, AMBER alerts) [In-review CSCW 2027]. I will surface the underlying neoliberalism and coloniality in AI safety research across security and privacy, HCI, ethics, psychology, and critical computing spaces. To do this, I will build on my workshop that calls for extending the definition of violence that transcends disciplinary boundaries [In-review DIS 2026] and counter-computing [In-review CHI 2027] resistance movements that counter the hegemonic technologies and infrastructures. I will generate keywords of concepts that capture the power differentials among people involved in the development of an AI model using the 'Calculating Empires' framework [23]. Then, I will use automated scraping methods [In-review CSCW 2027] and snowball sampling to collect a wide collection of relevant research articles, news reports, and, podcasts that formally or informally define ethics and privacy in global contexts. I will categorize these definitions into mode of harms, the actors involved (including people and the land), their impacts on actors, and the mitigation and harm-reduction strategies to negotiate and address ethical and privacy concerns. These will include communities strategies to resist, refuse, reclaim, and build new infrastructure for care, sovereignty, and liberation. Next, to ensure diversity in the definitions and by situating them in place and space, I will interview key stakeholders embedded in a variety of aspects of the AI lifecycle. For example, organizers fighting AI data centers, survivors of gender-based violence who use AI for support, immigrants who face social media surveillance, or, researchers that work on AI safety research. The interview will utilize the Meta-Relationality protocol [24] to surface a diverse set of orientations around affect (feelings about different kinds of AI?), mitigation strategy (what theory of change informs their response to AI?), time (how does the time of shape their stance?), and agency (what kind of leverage is possible and required?). I utilized this framework to conduct a workshop with top CS and Math researchers [HLF 2026]. I sensed rising tensions and uncertainty among scholars in the midst of planetary crises and scientific acceleration and corporatization and lack of perceived agency to shape the future of AI.

Findings and Impact. Findings from the study will result in a composite set of diverse contestations that show the agreements and contradictions across value-systems, social positions, and proximity to AI knowledge creation and usage. These contestations are necessary to inform the privacy interventions so that they center agency and liberation from AI-mediated violence: whether that may be refusal on ethical grounds, regulatory action or guardrails, resistance movement, decentralized

alternatives, sabotage from within academia or corporations, or, eco-social symbiotic technologies. This work reimagines how sovereign and culturally-sensitive, sustainable, sovereign, and ethical AI can manifest and benefit the communities.
