RESEARCH STATEMENT | Naman Gupta

My research goal is to make technology safer for *every* individual. Modern digital technologies have become integral to society, but also, increasingly being weaponized to perpetuate harms, at different scales: interpersonal harms (e.g. stalking, coercion, AI-generated porn) and structural harms (e.g. trafficking, genocide, environment collapse). Understanding such intersectional and deeply felt harms, however, requires a deep socio-technical expertise across many disciplines and epistemology. I re-imagine digital safety research by investigating how the socio-political dimensions of interpersonal relationship, physical proximity, and gendered-racial identity impact adversaries' power dynamics, victims' experiences, advocacy, and access to justice. Therefore, to design liberatory and sustainable interventions that can mitigate and break the cycle of violence, I center victims' needs, agency, and flourishing; moving their life state from survival to thriving.

To do this, I combine ethnographic, participatory, and design methods to study how technologies perpetuates gender-based violence (GBV) such as intimate partner violence, labor/sex trafficking, genocide, and environmental racism. Specifically, how **equitable sociotechnical interventions (e.g. education, tools, and advocacy practices) and research practices (e.g. methods, data, and design practices) can reduce and prevent harm among communities, helping them foster healing and safety**. I make contributions across two threads:

1. **Interventions to support GBV survivors and frontline providers:** I have designed interventions to develop confidence and capacity among GBV survivors and more than 200 frontline providers (health practitioners, legal justice workers, and policymakers). These interventions are currently deployed in practice through Madison Tech Clinic (MTC). I built an educational intervention for providers towards early detection, mitigation, and prevention of violence [In-review CSCW 2027]. Addressing survivor needs, I have built tools and advocacy practices to help collect and preserve evidence for legal injunctions [CSCW 2025, CHI 2026, CCS 2025, In-review USENIX 2027]. These interventions build on measurement of the prevalence of GBV in college contexts [CHI-LBW 2024] and characterization of survivors' support-seeking strategies and challenges faced before they reach out to frontline GBV providers [USENIX 2024, NDSS-LBW 2024].
2. **Research praxis to resist and liberate from structural violence:** Equitable interventions require studying violence at an intimate level; however, studying violence itself may reproduce more harm. I have created safe and culturally-sensitive methods, data, and design practices to support marginalized communities. I do this by studying how the history of colonial violence perpetuate through infrastructure (criminal databases, AMBER alerts, AI data centers) to violate Indigenous communities, epistemology, and land [In-review CSCW 2027]. Importantly, my work centers how communities resist, refuse, reclaim, and build new infrastructure for care, sovereignty, and liberation.

In the next several years, I will expand these two threads of research with a focus on emerging technologies (wearables, alert systems, AI generated content) to characterize the harms they pose to various communities. As I describe below, then, I will use community-engaged research process to envision interventions for mitigating and preventing violence.

Research Process. Despite being experts in lived knowledge, GBV survivors and frontline providers, especially from Indigenous communities, are often overburdened, under-compensated, exploited by academia, and epistemically underrepresented and silenced; all of which limit their participation in research. Thus, I build deep relationships with providers to understand their pressing issues, interpersonal and structural violence that impact their technology use, and their safety needs. With these insights, I develop research questions that can inform transformative interventions. Such an immersive engagement is essential to reduce the reflexive distance through sensitivity, which would otherwise not be possible through sources such as online forums, task workers, or AI agents. Then, I use a diverse variety of methods to collect data through interviews, surveys, online archives, and auto/ethnography. After an ethics review and data-sharing agreement (with Tribal nations), I invite survivors and providers to share their experiences by co-constructing a safe space with care and sensitivity. I analyze their data through mixed-methods approaches rooted in feminist, decolonial, and Indigenous epistemology. In fact, I utilize "Upstream Story" [10] framework (Figure 1) to build interventions that can (a) fulfill providers' immediate needs, (b) reduce harm and build capacity that enables providers to detect violence or prevent early. Then, I iterate on the intervention design, assess their effectiveness, and plan for long-term sustainability with the providers. Finally, I reciprocate my research by disseminating data and knowledge back to communities through talks, panels, and workshops at cross-disciplinary policy, law, and healthcare venues. Overall, this research process is slow, intentional, and challenging: emotional, traumatic, time-consuming, and logistically complex, especially with current academic uncertainties, but results in high-stakes impact on survivors' and providers' life. In doing so, I have contributed to interventions for survivors and providers (e.g. education, tools, and advocacy practices) that work towards violence prevention and harm-reduction.

1. Interventions to Support GBV Survivors and Frontline Providers. Globally, 1 in 3 women [11] and in US, 1 in 2 transgender [12] people experience physical, sexual, psychological intimate partner violence (IPV). Exposure to violence takes away power and agency from survivors, resulting in traumatic impacts (health inequities, censored cultural expression, economic dependence, etc.). To measure the scope and impact of tech-facilitated violence, it is crucial to understand the frequency of experiences, coping strategies taken by survivors before going to a DV shelter, and challenges they face.

Using college campuses as an example vulnerable environment for youth, who are among the most prevalent users of technology, I measured [CHI-LBW 2024] the prevalence of tech violence and support strategies, through a survey of 776 US college students in a large midwest R1 university. Alarmingly, 70% of students experienced such experiences: 60% faced unwanted

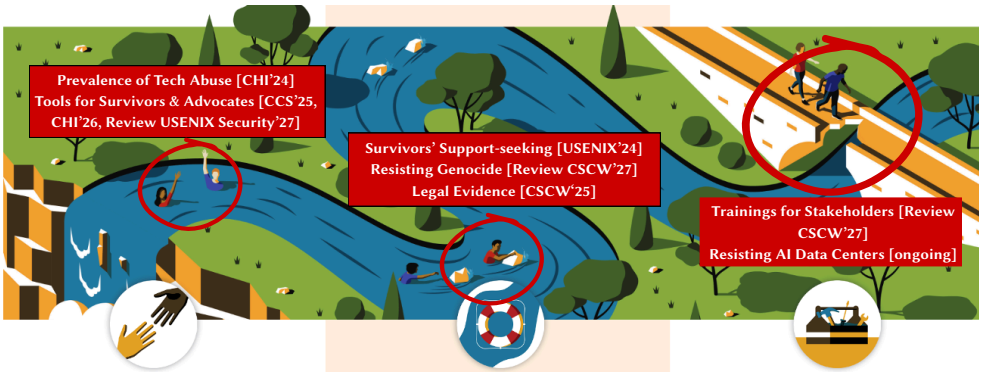

Figure 1: My work focuses on each part of the stream to effectively prevent violence by building interventions (a) downstream to support survivors' immediate needs after the abuse has occurred, (b) midstream to support survivors' coping strategies to mitigate abuse, and (c) upstream to prevent survivors from falling into the river.

calls and messages, 51% non-consensual sharing of intimate images, videos; or messages. Also, women (2x) and LGBTQ+ (3x) students were more likely to face violence than men, showing that tech violence is a gendered issue. Importantly, more than half of students (53%) did not seek support. When they did, most students (93%) solely relied on informal systems like friends and family, while only 6% solely sought formal systems. These statistics are essential for directing appropriate health resources and guiding restorative policy interventions for both student-victims and student-perpetrators. I plan to collaborate with UW university health center to build educational interventions around digital consent and sexual violence.

The prevalence study, however, does not explain *why* survivors do not seek support and what happens when they do. To understand this, I interviewed nine survivors to examine their experiences in seeking support from their community and the effectiveness of support in addressing their safety needs. This study [USENIX 2024] underlined the barriers that impeded the survivors from seeking informal an and formal support and the challenges they face before they even reach out to GBV frontline providers. Survivors are often disbelieved and provided with an ineffective advocate to mitigate abuse due to a lack of adequate resources. Moreover, providers use unsafe technological mediums to communicate, which is especially challenging when abusers often isolate them or escalate violence. Our findings revealed how survivors, despite not being technical experts, form an "ecosystem of care" by seeking help, and collaborating to provide help to others. The study has contributed to crucial contribution towards a foundational knowledge base on survivors' support-seeking strategies and challenges. Nonetheless, providers face a lot of knowledge gaps in identifying and mitigating newer, ever-evolving forms of tech violence, which becomes a deterrent for them in providing effective support to survivors.

To translate the years of research on IPV into practice, I developed [In-review CSCW 2027] educational interventions to build knowledge capacity among 200 providers across national, state, and local GBV organizations. The training programs fill these knowledge and skill gaps by providing a comprehensive understanding of tech violence, its impacts on survivors, and strategies to support them. To understand their effectiveness, we conducted evaluations through in-training discussions and through pre- and post-surveys with 68 providers. Training increased providers' confidence in providing support, safety planning, and referrals through community collaboration. Then, I conducted retrospective reflections through auto-ethnography to surface key lessons and tensions that emerged in coordinating logistics flexibly. We propose open questions that challenge and contest the positionality and field experience of the trainer and how they inform the content for accessibility and long-term learning. Through a novel design framework with 24 open questions that future scholars can use to build conceptual knowledge for the trainings in high-stakes contexts, translate them back to the community, and long-term sustainable provisioning.

Moreover, I helped design *Sherloc* (awarded best paper and an honorable mention) [CSCW 2025, CHI 2026], a tool that helps tech clinic consultants capture and prepare an evidence report that survivors can use to get legal injunctions such as a restraining order or a divorce settlement. Similarly, *Lestrade* (won the CSAW applied research competition) [CCS 2025, In-review USENIX 2027], that aides clinical investigations of account compromises through a user-friendly interface that reduces friction and uncertainty among tech clinic consultants, advocates, and survivors. Finally, my grant-awarded[1] outreach efforts at MTC have resulted in 50 remote consultations (25% of total consultations) with rural GBV organizations. I am currently evaluating the effectiveness of such a hybrid tech clinic service delivery model, the role of advocates in clinical investigations by situating survivors' experiences of tech violence in rural geographies and their service-seeking behaviors. My future goal is to inform research and practice towards establishing a local, sovereign, and culturally-attuned tech clinic within each organizations to scale up the tech clinic model.

2. Research Praxis to Resist and Liberate from Structural Violence. This line of work critiques the historical and ongoing role of technologies in perpetuating structural oppression, and how it manifests in and beyond bodies, ecology,

[1] Awarded $750,000 through Grant #15POVC-23-GK-01414-NONF, Office for Victims of Crime, US Department of Justice.

and knowledge systems. This thread envisions research that critically engages with epistemic injustices, extraction baked in technology design and research, while centering resistance and liberation from violence.

In the US, despite less than 3% of the population, 84.3% of Indigenous women face violence from a partner when 97% abusive partners are non-native (settler) [13]. Indigenous women are 10x more likely to be murdered than the national average [14] and represent 40% of sex trafficking victims across four sites in US and Canada [15]. However, most tribal nations cannot prosecute settler perpetrators due to lack of jurisdictional sovereignty, giving rise to an ongoing genocide called the Missing & Murdered Indigenous Relatives (MMIR) crisis. Modern technologies and infrastructure are ineffective in investigating missing persons cases, leaving most cases uncounted, unsolved, or improperly investigated. In this study [In-review CSCW 2027], I critique how infrastructure reinforce settler-colonial violence by creating "death spaces in darkness" that render Indigenous lives uncountable through bureaucratic systems instead of affording safety. To do this, I created a large-scale measurement pipeline that collected online archives: news articles, reports by advocates and police, podcasts, and court hearings. These archives countered epistemic erasure by portraying sacred stories of missing relatives, families, advocates, and tribal police. Next, I qualitatively analyzed 140 such archives by embodying Indigenous epistemology. Colonial institutions use infrastructure to repeatedly misuse or appropriate Indigenous knowledge. For example, Federal databases like NamUs (only 116 (2%) cases are recorded [16]) inaccurately collect data through opaque data sharing policies among tribal, state, and federal police. Initiatives by Royal Canadian Mounted Police (RCMP) to install 5G cell towers along the "The Highway of Tears" deliberately left out many highways with spotty cell coverage, showing clear signs of racism and ignorance. Finally, most tribes lack the agency and access to such criminal databases and are unable to release AMBER alerts. To resist, Indigenous communities mount a generational movement and resist, refuse, and reclaim infrastructure as spaces of advocacy, ceremony, memory, and care. Communities create alternate infrastructure through sovereign and crowd-sourced databases, digital maps to aide search and rescue missions, culturally-sensitive support and healing to families, and social media advocacy to raise awareness of the crisis. Through this work, we show how empirical methods can be re-imagined to critically engage with structural oppression. I provide relational design implications towards Indigenous sovereignty, jurisdictional tension, and governance of data infrastructures and platforms to balance surveillance, privacy, and safety needs of the families and advocates. Moreover, I have been invited[2] to collaborate on a book chapter on MMIR. Finally, I plan to design an intervention to support advocates with burnout, helping them automate sharing and removing posters shared on social media spaces.

Drawing on Indigenous epistemology, I study how ecological violence is intimately tied to GBV among Indigenous communities. For example, the oil fracking industry in North Dakota led to a 300% increase in sex crimes through "Man camps", temporary housing for transient workers [17]. Similarly, BigTech companies mimic extractive industries by scaling out hyperscale AI Data Centers (DC) in rural, drought-hit, and Black and Indigenous neighborhoods. For example, in 2023, Google's DC used over 66 billion litters of water for cooling, surpassing the water use of Los Angeles for 2 weeks [18]. I challenge this AI's accelerationist narrative by examining the impacts of DC on communities who live in proximity to them. To do this, I leveraged my GBV networks to conduct ethnographic interviews with the DC resistance organizers. However, organizers highlighted the urgency of the movement as more pressing than research participation. Respecting their refusal, I instead scraped online articles, reports, podcasts that hold stories of violent impacts of DC on communities. Through this work, we show how modern extractive infrastructure disrupt relational connections with Indigenous people and nature and create conditions of harm through resource extraction, reinforcing health and economic inequities, worsening climate conditions, and limiting communities' agency and visions of the future. To fight back, communities have been leading resistance movements that refuse the privatization of their land and reclaim technologies to organize knowledge-sharing workshops, responsible land-use policies, and social media activism. This work also reimagines how sovereign and culturally-sensitive, sustainable, and sovereign AI can benefit the communities instead of accelerating inequities.

Future Agenda. Rapid scientific development of new and emerging technologies (e.g. wearables, alert systems, AI generated content) perpetuate violence among communities. I will set up a community-engaged research program with my students to ensure that scientific development also provides safety and privacy to everyone. In short-term, I will develop interventions that helps providers detect violence early or prevent it altogether. In parallel, I will research how technologies accelerate structural violence towards marginalized communities. And in long-term, I will theorize and build safe, ethical, responsible, and sovereign technologies that dismantle structures of violence.

1. Capacity-building Interventions to Empower GBV Providers. Tech Clinics are a scarce resource that is not accessible to most survivors outside four metropolitan US cities[3]. One direction will **(a) enable frontline workers to detect GBV early**. Survivors typically fill out intake forms when they enter a hospital or shelter. Intake forms help first-responders (emergency rooms & sexual assault nurses) assess psychological, economic, and physiological safety. Embedding tech violence experiences questionnaires into the intake forms will enable providers to assess their digital safety early that can reduce trauma and health impacts. Then, workers can utilize a layered referral system to redirect survivors to appropriate expert support providers in time. For this, I will co-develop questions and training interventions to help educate first-responders identify signs

[3]There are four tech clinics in the US: CETA in New York City, MTC in Madison, TECC in Seattle, and MAVS-ETA in Arlington.

of tech violence through daily roll-call training. Secondly, I plan to signal a shift from individual safety plans towards a collectivist notion of safety, I will **(b) scale GBV providers to a peer support model** where healing happens with the community. In this model, peer support workers (PSWs) run support groups by sharing stories of violence and resilience [19]. These groups create a destigmatized space that redistributes epistemic and decision-making power, build technical skills, learn folk threat models, making safety planning less daunting for survivors. Utilizing my experience in training advocates [In-review CSCW 2027], I plan to co-design a structured program that empowers PSWs to effectively moderate and facilitate support groups. Finally, for many survivors, culturally sensitive support systems are often inaccessible. Geographic isolation leads to access barriers: lack of internet, digital literacy, resource constraints, and social barriers: cultural stigma, a close-knit community, police siding with abusers, slow justice system response. I will build a **(c) culturally-attuned tech clinic that weighs survivors' dynamically changing cultural safety needs**. This intervention will leverage the embedded knowledge infrastructure, weaving technology astuteness among the youth and generational teachings from Indigenous Elders. At MTC, we have conducted 50 remote consultations with 15 rural GBV organizations so far. My ongoing work evaluates the effectiveness of such an service delivery model and how tech clinic consultants and rural advocates have navigated these consultations.

2. Surfacing and Resisting Structural Violence. My work will continue to reckon with infrastructure that perpetuates structural violence faced by marginalized communities in the Majority World (e.g., violence survivors, war refugees, incarcerated, factory & delivery workers, immigrants, unhoused, construction workers). Intergenerational trauma faced by these communities have lasting health impacts. Such negative impacts may complicate their privacy and safety needs as more essential sector technologies get digitized. For example, what does privacy mean for international students who go through social media surveillance by the Government to maintain their immigration status? Similarly, what does privacy mean for exploited factory workers in India and Kenya who watch abusive content or wear cameras to train AI robots that will soon replace them? To answer these questions, I will draw on theories on change from privacy and surveillance, queer theory, black and decolonial feminism, incarceration and abolition, caste and labor exploitation, refugee resettlement, historicism and genealogy, and infrastructure inversion. My projects will **(a) measure the impacts of privacy challenges faced by communities subjected to structural violence**. Importantly, to acknowledge their daily flourishing and resistance, I will build on my MMIR work and **(b) examine how communities resist, refuse, and reclaim oppressive infrastructures or build infrastructures for healing and justice movements** and how their lived experiences can inform interventions and tech policy. Recognizing culture as a vital safety condition, my work will **(c) design frameworks for cultural preservation and revitalization through technologies** through stories, knowledge, languages at-risk of extinction. Finally, collaborating with health epidemiologists and violence-prevention practitioners, I will **(d) design technological visualizations tracing the systemic health inequities** with an aim towards providing culturally-competent interventions to curb them.

3. Diverse & Inclusive AI Safety Research. Scholars have noted that computing research and interventions reflect an imperial impulse [20, 21]. However, without engaging with theories of change that center decoloniality, sovereignty, and liberation, safety research may result in siloed privacy fixes that fail to challenge the immense power the Big Tech enterprise. For example, trust & safety teams in Big Tech companies often tout their products as private, ethical, carbon-neutral, whereas, the same companies actively harm miners who extract rare earth minerals in Congo and assemble their products in India. My computing and critical theory expertise allows me to view technologies not just as a black box, but as a combination of complex social and technical components. I will provide evidence to expand the definition of safety by tracing privacy violations in the entire lifecycle of BigTech AI systems. To do this, I will conduct a **(a) review the positionality of scholarships that underpin the digital safety research**. Is the prior work effectively addressing a variety of diverse harms and safety needs across AI abstraction layers, or, reinforcing a limited definition of online safety? Then, drawing on my workshops [HLF 2026, In-review CHI 2027, In-review DIS 2026], I plan to **(b) create a diverse and inclusive framework for AI safety by expanding the visions of privacy and impacts of violence to situate safety** in Global South and North. I will contrast how AI proliferation creates conditions of danger within communities due to the fundamental value misalignment between the corporations and communities. The framework will provide opportunities to shape AI towards being safe, sustainability, sovereignty, and equitable ethics.

Summary. To ensure that technology is safe and affirming for everyone, I build equitable sociotechnical interventions and research practices that can reduce and prevent harm among communities. In collaboration with impacted communities, I work by centering resilience, agency, and sovereignty of technologies for social good and collective well-being. I have made contributions across top-tier cross-disciplinary venues and supported more than 200 survivors and GBV frontline providers. Going forward, my research will advance safety, equity, justice, and diversity in computing, ensuring that stakeholders can reconcile and co-create towards equitable visions of the future.
